1. DESCRIPTION OF THE MODULE

The module "cdorderlimit" is a module enabling you to limit the orders of your shop according to the produced amounts of the cart/product or the quantity of products.

Moreover if these conditions are not observed, the process of order will not cross the stage 1 (which is the detail of the cart). But of the messages of prevention and errors are posted to direct the consumer.

2. INSTALLATION OF THE MODULE

For the installation, after having die-to zip the file of the module in the file "modules" of your shop, in the administration part of your shop, go in the page modulates. To seek the module either in the search bar fast or in the list of the module of your shop and installed it.

Or you can go to the menu "To add a module" who is in top and on the right of the page modulates as an administrator and to graft the zip of the module there.

3. ADDITION OF A NEW LANGUAGE

The module is provided with an English and French translation. If you wished to use it with another language, it is enough for you to translate it into this language in the administration part of your shop.

4. CONFIGURATION OF THE MODULE

In the page modulates part of administration of your shop, required the module and clicked on the bond configuration. It to present to you five (05) fields for the configuration of the module.

4.1. The field "Option of limit":

This field presents the options of limit to you to be applied to the orders. It should be noted that these options cart either on the whole order, or on types of products private

individual (or all) and or on types of categories of products (or all), according to the type of application which you would choose low. We thus have the options scientists:

- ✓ *minimum Amount in the cart;*
- ✓ *Maximum amount in the cart;*
- ✓ *minimum Quantity in the cart;*
- ✓ *maximum Quantity in the cart;*
- ✓ *Quantity in the multiple cart of;*
- ✓ *Quantity in the unmultiple cart of;*

4.2. The field “limiting Value”:

Here you enter the limiting value of the options limits higher. It is with this value that the module control either the amount, or the quantity of products of the cart.

4.3. The field “To apply to”:

This field enables you to specify where this are that you want that the constraints apply. Here we have two options:

- ✓ **Order:** who allows to apply the constraints to all the order. If it is on the rising one that is the constraint, then it applies to the full amount of the order and if quantity, it is on the quantity of product of the order.
- ✓ **Products:** who allow to apply the constraints to types of products or categories of products. This according to your choice in the two lower fields.

4.4. The field “Types of elements concerned”:

To be able to make a choice in this fields, the option should absolutely be chosen “Produced” in the field “To apply to”. Thus if you choose:

- ✓ **Products,** then the constraint will apply to well defined types of products. So if an order contains this kind of product, the constraint is applied.
- ✓ **Category of product,** then the constraint will apply to well defined types of categories of products. So if an order contains products of this kind of category, the constraint applies to the total of the products of this category contained in the cart.

4.5. The field “Ids Concerned”:

In this field, you enter ids of products or category according to your choice the field “Types of elements concerned”. Ids must absolutely be separated by commas not to have nuisances. If you choose to enter ids (of products or categories), the constraint will apply exactly to products or categories thus ids are contained in the entered list. So on the other hand you choose anything to enter like ids, then the constraint applies to all the products or categories contained in the basket.

Here is in some word mode of configuration of the module.

Example of configuration: “I want that a customer cannot order more than two products of the categories thus ids are 11 and 14”.

Solution:

- ✓ Option limits = maximum Quantity in the cart;
- ✓ Value limits = 2;
- ✓ To apply to = product;
- ✓ Standard of elements concerned = category of product;
- ✓ Ids Concerned = 11,14

5. UPDATE OF THE MODULE

If a new version of the module is found that you want to update your module, you will have to safeguard your data related to this module before updating then to restore these data. This to prevent that the update can erase your data.

6. SITE OF DEMONSTRATION

A site of demonstration for the module “cdcustomfields4orders” is available to: -----
------. You could not even due the stages carried out in face.

7. CONTACT
